NOVERA

NOVERA ONE wheeled indoor visitor-guidance research platform
Concept-stage founder review · 13 November 2026

Problem

Facilities managers, museums, university visitor centres and controlled indoor reception teams may face costly uncertainty in visitor guidance, repeated inquiries and indoor navigation. Interview whether existing staff, signs or kiosks already suffice.

Solution

NOVERA ONE wheeled indoor visitor-guidance research platform. Software prototypes demonstrate workflow only. No physical-product, regulated engineering or operational permission claim.

Product portfolio

ONE is primary; preserve ten general and fifteen specialized concepts as exploratory visual concepts. No medical, childcare, security or emergency-response competence.

Market and customers

Use the dated source register below. IFR service-robot categories indicate an industry landscape, but do not establish an addressable visitor-guidance market. TAM/SAM/SOM: TBD. Obtain segment counts, procurement budgets, interview records and bottom-up reachable account estimates before quoting market size.
Facilities managers, museums, university visitor centres and controlled indoor reception teams

Technology and progress

Gate 1: correct Candidate B geometry and mass/power arithmetic; Gate 2: ROS/Gazebo spawn, sensors and bridges; Gate 3: SLAM, saved-map localization, Nav2 mission and fault tests; Gate 4: independent physical safety design; Gate 5: supervised bench/prototype testing. Local 2D simulation is distinct from Gate 2–3. No purchased hardware or actual robot performance.

Alternatives and differentiation

PAL Robotics ARI and Pudu are primary-source landscape examples. Compare task scope, supervision, navigation interfaces, total service burden, privacy and verified operating evidence. Their existence establishes alternative solution categories, not NOVERA differentiation or demand. Human reception, accessible signage and kiosks may solve the problem at lower integration burden.

Business model hypothesis

Compare supervised pilot support, research software integration and maintenance scopes before considering hardware sale or Robot-as-a-Service. RaaS could bundle hardware, monitoring and service; it creates fleet financing, repair and liability burdens. Hardware sales require sourced BOM, assembly yield, warranty reserves and compliance. Neither model is price-validated. No pilot fee or customer revenue has been earned in the evidence inspected.

Validation evidence

Existing repository checks pass at baseline. Local software and browser tests are recorded separately in evidence/. No customer, physical product or commercial readiness claim.

Development roadmap

M1 (0–30 days target): reproduce repository tests and review scope. M2 (31–60): complete missing engineering integrations or bounded LABS delivery rehearsal. M3 (61–90): independently review evidence, costs and discovery findings. M4: founder decides continuation using measured gate evidence. These windows are planning targets, not delivery promises. See READINESS.md for actual status.

Financial scenarios

36-month editable workbook. Base revenue hypothesis is zero. Low/base/high cost assumptions are unquoted and unverified. Funding must be scoped to a reviewed gate. No investment commitment or valuation is claimed.

Risks and external gates

Principal risks: no demonstrated buyer need, insufficient qualified delivery capacity, inaccurate technical assumptions, privacy and image rights, unclear IP ownership, legal trading ability and capital shortfall. Mobile collision, tipping, battery and misleading interaction require physical safety review.

Funding strategy

Use financial-model.xlsx to estimate a gate-bounded cash requirement. No actual investment ask or valuation is justified yet. Obtain written engineering, hardware, legal and insurance quotes; confirm hiring capacity and taxes. EIC Accelerator is a public research lead only; eligibility, live call deadlines, legal status and co-financing remain unverified.

Founder review decision

Approve the next bounded evidence gate, qualified review roles and source-based budget. Do not approve public promotion or commercial launch until release gates close.
